Pepperfry Automation Testing Framework

Prepared By : Nazia khan

Project Overview

This project is an automation testing framework developed for the Pepperfry website. It is built using Selenium WebDriver, Java, TestNG and Maven. The framework uses Page Object Model design and explicit wait for synchronization to ensure stability and maintainability.

Framework Architecture

src/test/java
Base - Test setup and teardown
pages - Page Object classes like HomePage, ProductPage, CartPage
utils - DriverFactory, WaitUtils, ScreenshotUtils
report - Extent Report configuration
tests - All test classes

Execution Flow

Test Class -> BaseClass -> Driver initialization -> Page classes -> Test execution -> Reporting

Test Coverage

TC_01 Verify homepage loads

TC_02 Handle cookie popup

TC_03 Navigate category

TC_04 Apply filter

TC_05 Open product details

TC_06 Add to cart

TC_07 Verify product added to cart

TC_08 Update product quantity

TC_09 Remove product from cart

TC_10 Verify discount calculation

TC_11 Invalid pincode validation

TC_12 Valid pincode validation

TC_13 Brand and price consistency

TC_14 Search functionality

TC_15 Login functionality

Tools and Technologies

Java
Selenium WebDriver
TestNG
Maven
Extent Reports

Utilities Used

DriverFactory for browser handling
Explicit Wait for synchronization
Screenshot utility for failure capture
Config reader for properties

Reporting

Extent Reports used for execution report with logs and screenshots.

How to Run

Open project in Eclipse
Run using testng.xml or run test class directly

Conclusion

This framework is simple, reusable and scalable. It uses explicit wait and follows good automation practices.
